

308 EXCIMER SYSTEM – Small excimer, impressive effects

The 308 EXCIMER SYSTEM is the handy, highly effective treatment solution for intense monochromatic UVB therapy of autoimmune skin diseases. With its wavelength of 308 nm, the system is ideally suited for the treatment of psoriasis, vitiligo, alopecia areata and many other indications. The 308 EXCIMER SYSTEM allows you to treat patients just as quickly and effectively as with an excimer laser, but it is considerably smaller, easier to use and more flexible than a laser. With its comparatively low acquisition and operating costs, it is also more cost-effective.

Lesion targeting makes treatments with the 308 EXCIMER SYSTEM especially intense and effective. The variable power density – 50 to 6,000 mJ/cm² – can be adjusted to the individual treatment requirements. The 16 cm² spot with adaptable shape and size specifically targets the areas to be treated, making it possible to apply a much higher UVB dose than possible with UV cabins while leaving healthy skin unexposed. This reduces the number of treatment sessions required and improves patient comfort and clinical results significantly. The color touch screen and intuitive menu with integrated MED (Minimum Erythema Dose) test make treatments with the 308 EXCIMER SYSTEM very easy.
