

EXELO₂ – Your Fractional Way to Beauty

EXELO₂ is the proven CO₂ laser system for fractional treatments of wrinkles, scars, and pigmented skin alterations like melasma. A powerful laser combined with a versatile scanner make EXELO₂ a very fast and efficient system for visible skin rejuvenation through intense thermal stimulation of the collagen neosynthesis and micro-ablation zones. Its flexible treatment area makes EXELO₂ excellent for fast treatments of large and anatomically complex areas. The shape and size of the treatment area – up to 4 cm² – can be modified directly on the handpiece. Whether round, rectangular, or triangular, it always offers the perfect pattern without overlapping.

EXELO₂ assures both high patient satisfaction and convincing aesthetic results: With its innovative jumping scanning technology, the laser never shoots at neighboring zones, thus avoiding bulk heating. In addition, the special Random Mode enables good aesthetic results through slight displacement of the spots in the pattern. In the new Full Ablation Mode, removal of skin alterations is easily possible. The attachable cold air cooling greatly improves the patient comfort and even allows the treatment of darker skin types, without need for anesthesia or assistance.
