

## **IDAS – Green Light for Mobile Laser Power**

For many patients, telangiectasia, hemangioma and other red vascular skin changes are more than just bothersome: They impair their quality of life, especially if located in the face or décolleté. The powerful laser system IDAS can remove various vascular lesions fast, gently and with long-lasting results – often in only one session. Furthermore, its green light with 532 nm wavelength reliably removes solar lentigo and many other superficial pigmented skin changes. 8 watts peak power make IDAS one of the most powerful laser systems of its kind. With its high power, the use of big spot sizes and short pulses, IDAS allows you to specifically target skin changes while protecting the surrounding healthy skin.

### **Transportable, economic, flexible**

Optimal treatment results, easy handling and great cost effectiveness are three main benefits of the LBO laser system IDAS. The system has a compact design and an official transportation allowance, permitting the usage in different treatment rooms or offices. Thanks to its stable plug and play technology, no setup after transportation is required – IDAS is immediately ready for use. Five different spot sizes between 0.2 and 2 mm, flexible pulse width and repetition rates allow the treatment of various vascular and pigmented skin changes, always perfectly adapted to the patient's skin type, treatment area and individual indication. By mounting a sterile fiber, IDAS can also be used for endovascular therapy of varicose veins. Its continuous mode even allows IDAS to be used for smaller surgical indications.
